

## SMPS500R single and dual output

The SMPS500R Switched Mode Power Supply (SMPS) is specially designed to be used for Audio Amplifiers, both Linear Amplifiers such as class AB Amplifiers or Switched Amplifiers such as Class D or Class T. SMPS500R use state of the art, very efficient LLC Series Resonant Converter Topology. Due to the soft-switched topology used, the SMPS500R has very low EMI noise, lower losses and is more compact than a similar power rating classic hard-switched SMPS. Five output voltage ranges are available for stock SMPS500R, output voltage is regulated, and adjustable within  $\pm 10\%$  limits, making the SMPS500R suitable to be used with most of the Audio Amplifiers from the market, not just with the Connexelectronic ones.

### SMPS500R Features:

- LLC Series Resonant Converter Topology for high efficiency, up to 95.6% and lowest EMI.
- 230V AC and 120V AC models available.
- 500W Continuous Output Power with cooling, 650W Peak Output Power, 800W Short-Time Peak Power.
- Five output voltages versions available from stock: SMPS500R differential output:  $\pm 24V$   $\pm 32V$   $\pm 40V$   $\pm 50V$   $\pm 60V$  SMPS500R single Output: 24V 48V 72V all adjustable within  $\pm 10\%$ .
- Differential Auxiliary Voltage available, with voltage choice in range of  $\pm 10V$  to  $\pm 20V$  at 500mA.
- Complete protection set, Under-voltage, Overvoltage, Over-current, and Over-current Protection.
- Burst-Mode operation at low load or no-load for high efficiency.
- On-board Soft Start for smooth turns ON without current peaks or breaker tripping.
- Compact size, 100x100x44mm, lightweight, 400 grams.
- Screw type terminals for Mains Input and Voltage Output, convenient placed mounting holes.

**Fig.1 SMPS500R picture**

**SMPS500R Description:** The current for the audio amplifiers producers, both in HI-FI or Pro-Audio field, is to use a hard-switching unregulated SMPS or at most a Quasi-Resonant unregulated SMPS. The main reason behind this is the cost, which is much lower for such power supplies than for a regulated one; another reason is for easier synchronization of the power supply switching frequency with the half of the amplifier switching frequency to avoid beating. In some cases, is either not possible, or unnecessary. For example the Class T Audio Amplifiers, where the amplifier run at variable switching frequency, which depends on the input signal (spread spectrum modulation) and have value in range of 500 KHz to 1.5 MHz, for each channel independently, The LLC Series Resonant Converter also run at variable frequency, depending on the load value, typically in range of 110KHz to 250KHz. Being soft commutated, the SMPS intermodulation noise which might occur has very low value, below the S/N ration threshold, thus inaudible. The third reason for using unregulated SMPS for those amplifiers is that most of the class AB amplifies have high power supply rejection ratio which allows using an unregulated power supply without degrading their performances. But for the class D and class T amplifiers, this might be not enough, especially if Audiophile Sound Quality is required. Unlike many other amplifiers which are using SMPS, this Power Supply has regulated output voltage, providing a constant output voltage, from zero load to full load which translates in cleaner sound, without peaks and drops, without hard clipping and distortions and true, real deep bass, transparent and clean medium and high frequencies.

The topology used for the SMPS500R is Series Resonant Converter or LLC Converter. It was chosen due to its many advantages compared with all other topologies. Among the advantages, we consider that the most important are superior efficiency, up to 95.6% lower EMI and noise, compact size and reasonable complexity. The operation principle of this converter was described in many papers, application notes, and reference designs. Although is not a relatively new technology, being discovered more than 15 years ago, until recently, the lack of knowledge, documentation and availability of good characteristic electronic components such as high-speed MOS-FET's or IGBT's prohibited this topology to spread like other hard switched topologies. Only after the LCD and Plasma TV's came-up and initiatives to increase efficiency of the consumer products such as 80+, 90+ were imposed, engineers had to look towards other solution than the current, mature hard-switched topologies, which can't break the 90% efficiency barrier without significant cost increase and size. For an LLC resonant converter, efficiencies greater than 92% are common and even 95-96% can be achieved if the DC-DC converter is supplied from the output of an PFC pre-regulator capable to supply a constant 400V DC. In our case, the PFC stage is not required, due to the purpose of the application and because similar efficiencies can be achieved without using a complicated PFC circuitry which would increase the size of the SMPS board, EMI, and decrease the performance due to the fact that the available space is limited and the PFC inductor might interfere with other circuits operation.

An important aspect which must be considered when the SMPS500R is powered ON, the initial current drawn from the mains is few times higher than the average operating current. The reason for this is that the filter capacitors are completely discharged, and act as a short circuit for a brief period. The current is higher as the capacitors capacity and voltage is higher, and is proportional with the capacitor stored energy ( $CU^2/2$ ). To prevent harmful effects which this high value inrush current might have to the Power Supply components, a thermistor was used to limit the inrush current to a lower value than the mains fuse will trip or might damage any components from the Amplifier Power Supply. This thermistor is a passive component which has the property to decrease its resistance when the temperature increases. It has higher electrical resistance at low temperature, thus reducing the inrush current, and when the current which passes through, will heat-up the thermistor, the resistance will decrease, and the dissipated power will be reduces. One drawback might be the increased operating temperature, especially when the SMPS500R delivers high output power. The thermistor is placed on the edge of the board close to the Mains input connector, this avoiding heating-up other temperature sensitive components. Note that there is no need to use any other external power soft-start circuit when the SMPS500R is powered from standard mains supply voltage of 110 or 220V AC.

The SMPS500R features a soft-start characteristic, which allows progressive charge of the output filter capacitors, with a controlled charging current, without tripping overcurrent protection. The value and the working voltage of the output capacitors depend on the type of the SMPS, single or dual voltage, and the value of the output voltage. These capacitors have enough capacitance for most stringent applications, adding extra capacitors are not necessary or recommended, because if the capacitance is too high, the overcurrent protection might trip during power ON. Although the soft-switching characteristic allows the SMPS500R to run cooler than similar power hard-switched SMPS's, overtemperature protection was added. This consists of a circuit which monitors the temperature of the primary MOS-FET's and disables the power supply when the operating temperature reach 90°C.

**Warning:**

Before you proceed with installation, make sure you have read this warning SMPS500R:

The SMPS500R is powered from the mains voltage and the primary side of the SMPS has hazardous voltages up to 340V DC and up to 500V AC. This voltage levels are present on the top and bottom of the board, and during installation and operation should never touch any part of the SMPS while it is connected to the mains and at least 5 minutes after complete disconnect from mains. If any adjustment or reconnection needs to be done, disconnect the unit from the mains and allow all capacitors to discharge for at least 5 minutes before handling it. Any ignorance of this warning will be made on user's responsibility, and can lead to serious injuries and possible death by electrocution if is handled improperly. This product has no serviceable parts other than the on-board mains fuse. In case of blown fuse, only replace the fuse with the same type and rating. Do not attempt to change any other component from the SMPS500R. A safety clearance of at least 6mm must be kept between the board and the case, or any conductive part of the amplifier. The heat transfer between the heatsinks and ambient must not be obstructed for proper operation.

**SMPS500R characteristics:**

Model:	SMPS500R±24V	SMPS500R±32V	SMPS500R±40V	SMPS500R±54V	SMPS500R24V	SMPS500R48V	SMPS500R72V

The SMPS500R dual voltage version, Auxiliary output can be used to supply power for other stages of the amplifier, such as preamplifier, speaker protection, cross-over, etc. the SMPS500R dual output version provide a differential auxiliary output voltage in range of  $\pm 11$  to  $\pm 17V$ , depending on the main output voltage. The auxiliary output voltage depends on the number of turns of the auxiliary winding, which is a fraction of the number of turns of the main output winding. The auxiliary output voltage is not regulated, but the value is kept tight within 10% limits due to the good magnetic coupling with the main output winding. For noise sensitive applications further regulation is recommended. The GND of the auxiliary output is isolated from the main output GND.

The SMPS500R single voltage version, Auxiliary output is a single voltage, regulated with an additional linear regulator, LM78xx series, and the voltage value can be +5V, +12V, +15V at 0.5A continuous current or 1.2A peak current. The GND of the auxiliary output is isolated from the main output GND.

The SMPS500R dual voltage board size is 100x100mm and 40mm tall. It has 4 mounting holes at the corners of the board, 4mm distance from the edge. SMPS500R single voltage board size is 100x100mm pcb size plus 10mm heat sink span outside from the board for better cooling and air convection. Height is 40mm and it has 4 mounting holes, 2 of them at bottom, 4 mm from the edge and 2 of them at top, 10.8mm from the edge.
